

Janne Ofversten, day1 (battery and so on), nokia seminar

nokia trends

- cloud computing
- context awareness
- augmented reality

Energy need vs. availability

*) Nokia internal analysis

Two days of battery life cannot be achieved with current batteries and the gap is getting bigger!

4

NOKIA

- N97 without activity - 5mA, 300 hours
- N97 with activity 6 background apps - 55mA, 27 hours
- battery capacity increases 5-10% annually
- battery is the biggest component in the device
- they optimize number of network accesses and amount of transferred data. (could we consider an optimization by using several kinds of networks)

consumers

- cpu, display, wireless
- software optimization decreases power consumption too
- active pixels consumes a lot
- opt: draw something if it is actually seen by user
- efficiency of network depends on conditions: NW strength, broadcast

- growing netw applications, like keep alive tcp - there are places for doing somethig
- connected applications is the biggest challenge
- tradeoff signalig: availability vs energy

QA

- Energy profiler works only on Symbian;
- They are considering to support EP on MAEMO;
